

DataForge Analytics
Backend & Data Engineering Intern

About the role

We are a small platform team building the pipelines and services behind our analytics product. You will work alongside two senior engineers and own real features from schema to deployment.

Required Skills

- Strong Python, including writing testable code
- SQL and relational database design, ideally PostgreSQL
- Building and consuming REST APIs
- Docker for local development and deployment
- Git and a working habit of code review
- Data structures and an understanding of algorithmic complexity

Preferred Skills

- Django or FastAPI experience is a strong plus
- Familiarity with pandas for data analysis
- Exposure to AWS or another cloud platform
- Celery or any task queue
- CI/CD pipelines

What you will do

- Design schemas and write the migrations behind them
- Build internal APIs the analytics dashboard consumes
- Containerise services and help move them to staging
- Write tests, review pull requests and keep the pipeline green

Location

Bengaluru, hybrid. Six month internship with a full-time conversion path.
